Time series econometrics is a rapidly evolving field. Particularly, the cointegration revolution has had a substantial impact on applied analysis. Hence, no textbook has managed to cover the full range of methods in current use and explain how to proceed in applied domains. This gap in the literature motivates the present volume.

The course treats econometric methods for analysis of time series with a particular focus on applications in finance and macroeconomics. The topic deals with strategies for empirical modelling of dynamic models. Methods for modelling non-stationary variables are emphasised. The course introduces methods for studying non-linear models and regime shifts, modelling volatility in financial variables and the use of panel data.

Many of the principles and properties that we studied in cross-section econometrics carry over when our data are collected over time. However, time-series data present important challenges that are not pres ent with cross sections and that warrant detailed attention. Random variables that are measured over time are often called " time series. "

[CHAPTER 1 Fundamental Concepts of Time-Series Econometrics](#)

Time series are used in statistics, signal processing, pattern recognition, econometrics, mathematical finance, weather forecasting, earthquake prediction, electroencephalography, control engineering, astronomy, communications engineering, and largely in any domain of applied science and engineering which involves temporal measurements.

[Time series - Wikipedia](#)

Time series data is data is collected for a single entity over time. This is fundamentally different from cross-section data which is data on multiple entities at the same point in time. Time series data allows estimation of the effect on Y Y of a change in X X over time. This is what econometricians call a dynamic causal effect.

The author also introduces and explains techniques that are widely used in applied work, although rarely introduced in detail in non-specialist texts. These include integrated time series, cointegration, simulation analysis, Johansen's approach to multivariate cointegration and ARCH. The text also illustrates the central distinction between stationary and non-stationary time series, which is of crucial importance in many areas of analysis, especially in macroeconomics and financial economics.

Characteristics of Time Series The first step in building dynamic econometric models entails a detailed analysis of the characteristics of the individual time series variables involved. Such an analysis is important because the properties of the individual series have to be taken into account in modeling the data generation process (DGP) of a system of potentially related variables.

This course provides an introduction to the basics of nancial econometrics, mainly to analyzing nancial time series. There are many more topics in nancial econometrics that cannot be covered by this course but are treated in advanced textbooks such asFranke et al.(2011) orTsay(2010).
