Stroke 2 (compression) air is compressed to high. extent, raising temperature. Stroke 3 (power) diesel is injected, high air. temperature ignites diesel. Stroke 4 (exhaust) burnt gases are expelled from. the engine.

A.5 DIESEL ENGINE CYCLE Diesel engines may operate at a very fast combustion rate, approaching constant volume for most of the fuel. Such an operation is obtained when the delay period is long enough that the fuel injected is quite well mixed and most is evaporated before the combustion. However, such an operation is undesirable, due to the
