An overview of the linear referencing tutorial - ArcGIS

There are two primary data types that are used to implement linear referencing in ArcGIS: Route feature classes; Event tables; Using dynamic segmentation, events from event tables are located on line features in a route feature class. Route feature classes. A route feature class is a line feature class that has a defined measurement system.

Linear referencing is a method of storing distance and temporal data that adds a new dimension to line features. Learn linear referencing concepts and how to create and edit the data required for linear referencing-based mapping and analysis.

Getting Started with Linear Referencing | Esri Training ...

A linear reference system stores data using a relative position along existing line features. That is, location is given in terms of a known linear feature and a position, or measure, along it. For example, route 1-10, mile 23.2, uniquely identifies a position in geographic space, and can be used instead of an x,y coordinate. When data is linearly referenced, multiple sets of attributes can be associated with any portion of an existing linear feature, independent of its beginning and end.

An overview of the Linear Referencing toolbox—ArcGIS Pro ...

Linear referencing is the method of storing geographic locations by using relative positions along a measured linear feature. Distance measures are used to locate events along the line: Locating a point event and a line event by measures along a line Measurements along features are used to locate point events and line events using a number of conventions.

In Linear Referencing routes should normally be continuous for the entire linear feature (i.e., an entire road, stream course, etc.) to create the maximum set of measures. Routes work best if they are simple.
